B Public state → prospective action → full consequence

Identity progress, service unfinished

3 explicit identity conflicts cease to appear.
Raw stage counts do not increase.

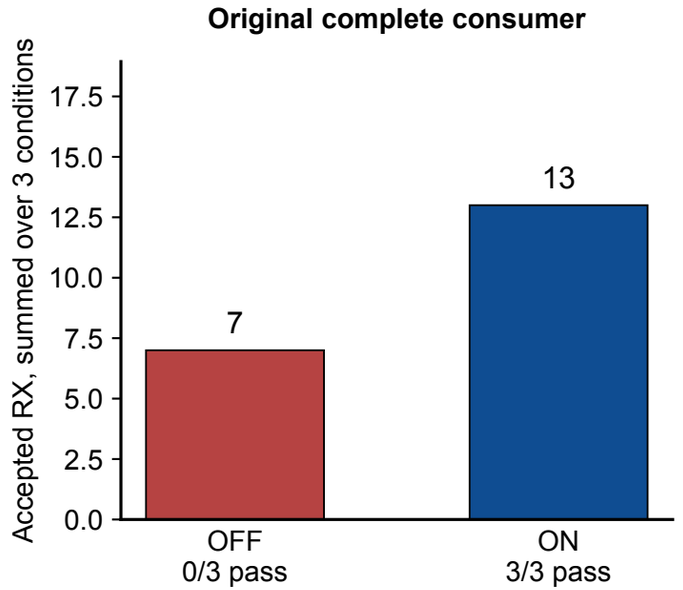

Capture / SAVE / TX / RX / ACK
7 / 7 / 7 / 7 / 7

Same facts + common joint pool + seed

ON: startup 3.2 → 1.9 V
Earlier powered sampling; brownout risk remains.

OFF: general joint mutation selected
brownout_v, mechanism, startup_v, tx_reserve_v, holding_component

Prediction before execution: full service UNKNOWN.
These are seen development prefixes.

Saved records, no completed wire frames

Capture / SAVE / TX / RX / ACK
18 / 18 / 0 / 0 / 0

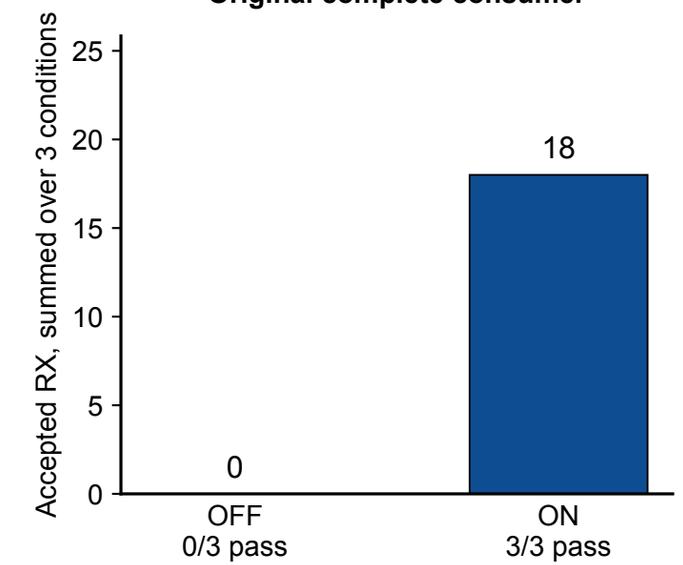

SAVE→wire obligation remains pending.
Energy, eligibility and timing causes UNKNOWN.

Same facts + common joint pool + seed

ON: C 100 → 257 µF; ESR 49.81 → 0.1 Ω
C ≥ Q / (Vgate − Vbrownout − reserve − ESR·I).
Startup delay remains an explicit side effect.

OFF: general joint mutation selected
debounce_s, mechanism, persistent_queue, tx_gate_v, backoff_max_s

Prediction before execution: full service UNKNOWN.
These are seen development prefixes.

v2: actual source-bound component-duty expansion (static check)

Holder enabled
CONSUMPTION = false
→
Add holding_then_contact reader
CONSUMPTION = true
→
Optional siblings from capacity UNKNOWN
early: handoff false · SAVE / ACK: supported

Dynamic timing, energy and capacity remain UNKNOWN. The four selected prefix actions are unchanged numeric probes; no executed holder-closure benefit is established.

Counts are raw operations / accepted records, not independent true events. 12 logical condition evaluations = 9 new + 3 exact reuses. Seen development prefixes.
